Service Blueprint

For delivering smooth service we are planning a long-term service design that stretches beyond sales from discovery, delivery to daily use and maintenance. Ordering is based on a yearly subscription.

A plan for testing our assumptions

Assumptions about the future:

- High demand: as the needs of elderly healthcare rise and birth rates decline, there will be an increasing demand for robotic nurses.
- Shortage of healthcare professionals: a declining population with a high amount of elderly will lead to a labour shortage in health care which leads to an increasing need for a robotic solution.
- Cost-effective: Robotic care is a more affordable alternative to human labour.
- Preference for home care: Elderly people will continue to prefer to live at home as long as possible, which would create a need for in-home robotic assistance.
- Feasibility: Technological advancements in robotics will make caregiving robots a viable and cost effective solution.
- Privacy concerns: users are fine with having wearable tech on them for data collections and are fine with usages and collection of this data, also the use of a camera does not bother the in-home users.
- Emotional comfort: Elderly users will see the robotic companion as a supportive friend rather than just a robot.

Rank:	Hypothesis	Test Method	Decision Criteria
1	High demand: Increase in demand for robotic caregivers as the elderly population grows	Market research, public health data analysis and some interviews with healthcare professionals	At least 60% of healthcare professional predict an increase in need of robots in the next 5 years
3	Shortage of healthcare professionals: Will increase need for robotic solutions	Labor market reports and interviews with healthcare staff	Reports show a 10% decrease in the labor market for health care in the next 5 years. 50% of interviewed staff confirm that there is a shortage in the labor force.
6	Robotic care is more cost-effective than hiring full-time caregivers	Cost comparison analysis for the cost of our product vs cost of labor, interviews with insurance companies	Robotic care must at least be 10% cheaper than equivalent traditional labor in long term.
4	Elderly prefer home care	Surveys and interviews with seniors	60% of elderly people prefer to have home care
2	Feasibility: Technological advancements in robotics will make caregiving robots a viable and cost effective solution.	Trend analysis, research and development of a prototype and making a proof of concept	The prototype must at least be able to perform 80% of the planned core features
7	Privacy concerns: users are fine with having wearable tech on them for data collections and are fine with usages and collection of this data, also the use of a camera does not bother the in-home users.	Surveys with our customer segment	70% of the possible users report an willingness to have wearable tech on them, 50% are fine with having an camera at home
5	Emotional comfort: Elderly users will see the robotic	User testing, interviews	At least 50% of the elderly users from the user testing report a positive

	companion as a supportive friend rather than just a robot		experience during the test period for example ½ month.

Stress Test:

(<https://docs.google.com/spreadsheets/d/1W8jsJ1iB9LHIWOqatJlhG0YynToG5qj95VSz3Plu3sk/edit?gid=0#gid=0>)

			Development 1: (Social development) The trend of a aging population continues, while the birth rate at the same time falls, leading to shrinking work force in the healthcare sector.	Development 2: (Economical development) Changes in tariffs and/or trade agreements are imposed on components which increase hardware costs by 20-30%	Development 3: (Technological development) Advancemnets in NLP, ML, and robotics enable more sophisticated functional care robots.
WHO	Care Providers		Increased need for alternatives as the work force declines.	Our product increases in price, and is less competitive	Increased trust in our product
	Municipalities		Increased need for alternatives as the work force declines.	Our product increases in price, and is less competitive	Increased trust in our product
	Private Individuals		Increased need for alternatives as the work force declines.	Our product increases in price, and is less competitive	Increased trust in our product
WHAT:	Daily routine managment				Technology improves, making our product better
	Emergency support				Technology improves, making our product better, also less false positives
	Emotional support		Increased need as more and more people can feel left outside		Technology improves, making our product better
HOW:	Producers and suppliers of robots/components			Our product increases in price, and is less competitive	
	Software developers/ technological partners			Decrease in development as margins for profit decrease	
	Insurance companies			Our product increases in price, and is less competitive, results in that insurance could go back to their old ways	
WHY:	Research and development costs		Increase in research and development costs as more copetitors will arise.		Can both decrease or increase development costs
	Marketing		The product should need less marketing as the need increase		
	Revenue from sales		Increase in sales	Negative impact in sales
